

# SMB Signing disabled on the target

---

**A SMB relay attack is where an attacker captures a users NTLM hash and relays its to another machine on the network. Masquerading as the user and authenticating against SMB to gain shell or file access.**

Requirement:

**SMB Signing disabled on the target**

**Must be on the local network**

**User credentials must have remote login access for example; local admin to the target machine or member of the Domain Administrators group.**
